4.4.1 Detailed Description

Support different endian modes when reading and writing the metafile.

To support different endian modes, rather than just writing the structures directly to a file via fwrite(&emr, ...), we have to write each element of the structure separately, swapping bytes as necessary. datastream supports this. Remarkably similar to the QDataStream class from Qt. So, too, for reading.

Enhanced Metafile Header Record.

The ENHMETAHEADER serves two purposes in this library: it keeps track of the size of the metafile (in physical dimensions) and number of records and handles that are ultimately to be written to the disk file. It is also a real record that must be written out.

description	an optional description argument is a UNICODE-like string with the following format: "some text\0some more text\0\0". The W32 interface defines UNICODE characters to be two-byte (unsigned short strings). The constructor makes a copy of the argument.

4.62.1 Detailed Description

Stores all the objects in a single database within a process.

4.62.2 Member Function Documentation

add()

```
HGDIOBJ EMF::GLOBALOBJECTS::add (
            OBJECT * object)
```

Add an object to the global vector. The object's handle is simply its index in the global object vector, which is computed by the very interesting "difference between two iterators" method.

Parameters

object	pointer to a real instance of an object, not its handle.

begin()

```
auto EMF::GLOBALOBJECTS::begin (
            void ) const  [inline]
```

Returns

an iterator pointing to the first global object.

end()

```
auto EMF::GLOBALOBJECTS::end (
            void ) const  [inline]
```

Returns

an iterator pointing to (one past) the final global object.

find()

```
OBJECT * EMF::GLOBALOBJECTS::find (
            const HGDIOBJ handle)
```

Look up a object by handle in the global object vector. Note: Stock objects (like a gray brush or the black pen) have their high order bit set, so this has to be masked out when using their handles.

Parameters

handle	the object's handle.

Returns

pointer to object.

newRecord()

```
METARECORDCTOR EMF::GLOBALOBJECTS::newRecord (
            DWORD iType) const
```

See if we have a constructor for a record of the given type.

Parameters

iType	metarecord type.

Returns

pointer to "virtual" constructor.

remove()

```
void EMF::GLOBALOBJECTS::remove (
            const OBJECT * object)
```

A call to the metafile function DeleteObject() allows a particular object's handle to be reused, so some care has to be taken to erase it.

Parameters

object	pointer to object to delete.

4.65.1 Detailed Description

Graphics Device Context.

Almost all GDI graphics calls require a device context (except those which create graphics objects such as pens and fonts). This is a specific context which renders to a metafile. There is a one-to-one correspondence between the device context and the metafile.

4.65.2 Constructor & Destructor Documentation

METAFILEDEVICECONTEXT()

```
EMF::METAFILEDEVICECONTEXT::METAFILEDEVICECONTEXT (
            FILE * fp_,
            const RECT * size,
            LPCWSTR description_w)  [inline]
```

Most graphics programs seem to want to handle the opening and closing of files themselves, so this is an extension to the w32 interface.

Parameters

*fp_*	stdio pointer to an open file. May be null.
size	the rectangle describing the position and size of the metafile on the "page". May be null.
description_w	a UNICODE string describing the metafile. The format must be "some text\0some more text\0\0". May be null.

References ds, and fp.

~METAFILEDEVICECONTEXT()

```
virtual EMF::METAFILEDEVICECONTEXT::~METAFILEDEVICECONTEXT ()  [inline], [virtual]
```

Destructor frees all the graphics objects which may have been allocated. Now, it also frees any metarecords which it might hold, too.

appendHandle()

```
void EMF::METAFILEDEVICECONTEXT::appendHandle (
            METARECORD * record)  [inline]
```

Parameters

record	this record is an object so it increments the handle count as well.

References header, records, and EMF::METARECORD::size().

appendRecord()

```
void EMF::METAFILEDEVICECONTEXT::appendRecord (
            METARECORD * record)  [inline]
```

Parameters

record	standard graphics record

References header, records, and EMF::METARECORD::size().

getType()

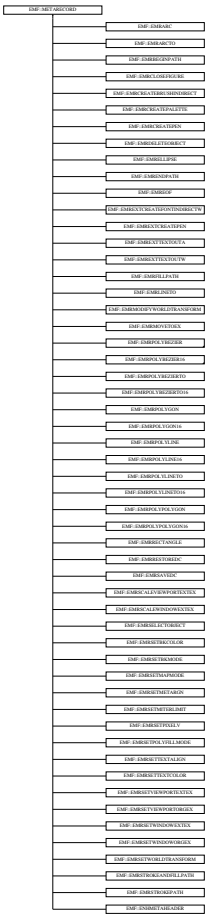
4.66 EMF::METARECORD Class Reference

The base class of all metafile records.

`#include <libemf.h>`

Inheritance diagram for EMF::METARECORD:



Public Member Functions

- virtual void execute (METAFILEDEVICECONTEXT ∗source, HDC dc) const =0
- virtual bool serialize (DATASTREAM ds)=0
- virtual int size (void) const =0
- virtual ∼METARECORD ()

4.66.1 Detailed Description

The base class of all metafile records.

A metafile consists off a sequence of graphics records "executed" in order. This is a common base class that allows each, different, record to be stored in a common list. An interface is specified for each record to write itself to a file.

4.66.2 Constructor & Destructor Documentation

~METARECORD()

```
virtual EMF::METARECORD::~METARECORD ()  [inline], [virtual]
```

The virtual destructor allows records which allocated additional memory to release it when they are deleted. Simple records just use the default destructor defined here.

4.66.3 Member Function Documentation

execute()

```
virtual void EMF::METARECORD::execute (
            METAFILEDEVICECONTEXT * source,
            HDC dc) const  [pure virtual]
```

Execute the graphics command in the given context. Used by PlayEnhMetaFile to "copy" one metafile into another.

Parameters

source	the device context from which this record is taken.
dc	the destination context.

Implemented in EMF::EMRARC, EMF::EMRARCTO, EMF::EMRBEGINPATH, EMF::EMRCLOSEFIGURE, EMF::EMRCREATEBRUSHINDIRECT, EMF::EMRCREATEPALETTE, EMF::EMRCREATEPEN, EMF::EMRDELETEOBJECT, EMF::EMRELLIPSE, EMF::EMRENDPATH, EMF::EMREOF, EMF::EMREXTCREATEFONTINDIRECTW, EMF::EMREXTCREATEPEN, EMF::EMREXTTEXTOUTA, EMF::EMREXTTEXTOUTW, EMF::EMRFILLPATH, EMF::EMRLINETO, EMF::EMRMODIFYWORLDTRANSFORM, EMF::EMRMOVETOEX, EMF::EMRPOLYBEZIER16, EMF::EMRPOLYBEZIER, EMF::EMRPOLYBEZIERTO16, EMF::EMRPOLYBEZIERTO, EMF::EMRPOLYGON16, EMF::EMRPOLYGON, EMF::EMRPOLYLINE16, EMF::EMRPOLYLINE, EMF::EMRPOLYLINETO16, EMF::EMRPOLYLINETO, EMF::EMRPOLYPOLYGON16, EMF::EMRPOLYPOLYGON, EMF::EMRRECTANGLE, EMF::EMRRESTOREDC, EMF::EMRSAVEDC, EMF::EMRSCALEVIEWPORTEXTEX, EMF::EMRSCALEWINDOWEXTEX, EMF::EMRSELECTOBJECT, EMF::EMRSETBKCOLOR, EMF::EMRSETBKMODE, EMF::EMRSETMAPMODE, EMF::EMRSETMETARGN, EMF::EMRSETMITERLIMIT, EMF::EMRSETPIXELV, EMF::EMRSETPOLYFILLMODE, EMF::EMRSETTEXTALIGN, EMF::EMRSETTEXTCOLOR, EMF::EMRSETVIEWPORTEXTEX, EMF::EMRSETVIEWPORTORGEX, EMF::EMRSETWINDOWEXT EMF::EMRSETWINDOWORGEX, EMF::EMRSETWORLDTRANSFORM, EMF::EMRSTROKEANDFILLPATH, EMF::EMRSTROKEPATH, and EMF::ENHMETAHEADER.

serialize()

```
virtual bool EMF::METARECORD::serialize (
            DATASTREAM ds)  [pure virtual]
```

Write yourself to the given file. This is virtual since some records are of arbitrary length and need to write additional information after their EMR structure.

Parameters

ds	the datastream to write oneself to.

Implemented in EMF::EMRARC, EMF::EMRARCTO, EMF::EMRBEGINPATH, EMF::EMRCLOSEFIGURE, EMF::EMRCREATEBRUSHINDIRECT, EMF::EMRCREATEPALETTE, EMF::EMRCREATEPEN, EMF::EMRDELETEOBJECT, EMF::EMRELLIPSE, EMF::EMRENDPATH, EMF::EMREOF, EMF::EMREXTCREATEFONTINDIRECTW, EMF::EMREXTCREATEPEN, EMF::EMREXTTEXTOUTA, EMF::EMREXTTEXTOUTW, EMF::EMRFILLPATH, EMF::EMRLINETO, EMF::EMRMODIFYWORLDTRANSFORM, EMF::EMRMOVETOEX, EMF::EMRPOLYBEZIER16, EMF::EMRPOLYBEZIER, EMF::EMRPOLYBEZIERTO16, EMF::EMRPOLYBEZIERTO, EMF::EMRPOLYGON16, EMF::EMRPOLYGON, EMF::EMRPOLYLINE16, EMF::EMRPOLYLINE, EMF::EMRPOLYLINETO16, EMF::EMRPOLYLINETO, EMF::EMRPOLYPOLYGON16, EMF::EMRPOLYPOLYGON, EMF::EMRRECTANGLE, EMF::EMRRESTOREDC, EMF::EMRSAVEDC, EMF::EMRSCALEVIEWPORTEXTEX, EMF::EMRSCALEWINDOWEXTEX, EMF::EMRSELECTOBJECT, EMF::EMRSETBKCOLOR, EMF::EMRSETBKMODE, EMF::EMRSETMAPMODE, EMF::EMRSETMETARGN, EMF::EMRSETMITERLIMIT, EMF::EMRSETPIXELV, EMF::EMRSETPOLYFILLMODE, EMF::EMRSETTEXTALIGN, EMF::EMRSETTEXTCOLOR, EMF::EMRSETVIEWPORTEXTEX, EMF::EMRSETVIEWPORTORGEX, EMF::EMRSETWINDOWEXT EMF::EMRSETWINDOWORGEX, EMF::EMRSETWORLDTRANSFORM, EMF::EMRSTROKEANDFILLPATH, EMF::EMRSTROKEPATH, and EMF::ENHMETAHEADER.

size()

```
virtual int EMF::METARECORD::size (
            void ) const  [pure virtual]
```

The header record of a metafile records the total size of the metafile in bytes, so as each record is added to the list, it updates the total size.

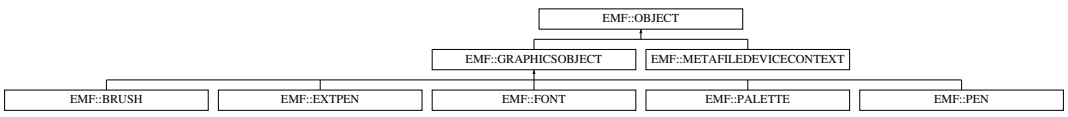
4.67 EMF::OBJECT Class Reference

Global GDI object.

`#include <libemf.h>`

Inheritance diagram for EMF::OBJECT:



Public Member Functions

- virtual ~**OBJECT** ()

  OBJECTs have a virtual destructor.
- OBJECT (void)
- virtual OBJECTTYPE getType (void) const =0

Data Fields

- HGDIOBJ handle

4.67.1 Detailed Description

Global GDI object.

The GDI interface defines objects in terms of handles (rather than pointers). In order to emulate this, each object is placed into a global list and the index in that list becomes their handle.

4.67.2 Constructor & Destructor Documentation

OBJECT()

```
EMF::OBJECT::OBJECT (
            void )  [inline]
```

Create a new object. It's up to a subclass to create a real handle for this object.

References handle.

4.67.3 Member Function Documentation

getType()

```
virtual OBJECTTYPE EMF::OBJECT::getType (
            void ) const  [pure virtual]
```

Return the type of the object.

Implemented in EMF::BRUSH, EMF::EXTPEN, EMF::FONT, EMF::METAFILEDEVICECONTEXT, EMF::PALETTE, and EMF::PEN.

```
HGDIOBJ EMF::OBJECT::handle
```
